

Wireless actuator
Multifunction impulse switch
FMS61NP-230V

Only skilled electricians may install this electrical equipment otherwise there is the risk of fire or electric shock!

Temperature at mounting location:
-20°C up to +50°C.
Storage temperature: -25°C up to +70°C.
Relative humidity:
annual average value <75%.

valid for devices from production week 11/14 (see bottom side of housing)

1+1 NO contacts not potential free
10A/250V AC, incandescent lamps up
to 2000 watts. Encrypted wireless,
bidirectional wireless and repeater function
are switchable. Only 0.8 watt standby
loss.

For installation.
45 mm long, 45 mm wide, 33 mm deep.
Supply voltage, switching voltage and
control voltage local 230V.

If a power failure occurs, the switching
state is retained. If a power failure occurs
repeatedly, the device is switched off in a
defined sequence.

This wireless actuator is a multifunction impulse switch and features state-of-the-art hybrid technology that we developed: we combined the wear-free receiver and evaluation electronics and two bistable relays with zero passage switching.

By using a bistable relay coil power loss
and heating is avoided even in the on
mode. After installation, wait for short
automatic synchronisation before the
switched consumer is connected to the
mains.

In addition to the wireless control input
via an internal antenna, this multifunction
impulse switch can also be controlled
locally by a conventional 230V control

switch previously mounted (in the 2xS
function only contact 1).

Maximum current as the sum of both
contacts 16A at 230V.

Starting in production week 11/14, you can teach in encrypted sensors. You can switch on **bidirectional wireless** and/or a **repeater** function.

Every change in state and incoming
central command telegrams are then
confirmed by a wireless telegram.
This wireless telegram can be taught-in
in other actuators, in the GFVS software
and in FUA55 universal displays.

Function rotary switches

With the top rotary switch in the setting
LRN up to 35 wireless pushbuttons can
be assigned therefrom one or more
central control pushbuttons. The required
function of this multifunction impulse
switch can then be selected. Switching
will be visualised by flashing of the LED.

2xS = 2fold impulse switch each with
1 NO contact

2S = impulse switch with 2 NO contacts

WS = impulse switch with 1 NO contact
and 1 NC contact

SS1 = impulse multicircuit switch 1+1 NO
contact with switching sequence 1

SS2 = impulse multicircuit switch 1+1 NO
contact with switching sequence 2

Switching sequence SS1:

0 - contact 1 - contact 2 - contacts 1+2

Switching sequence SS2:

0 - contact 1 - contacts 1+2 - contact 2

The bottom rotary switch is only required
to teach-in the transmitters.

The LED performs during the teach-in
process according to the operation manu-
al. It shows wireless control commands
by short flickering during operation.

Typical connection

Technical data

Rated switching capacity 10A/250V AC
each contact

Incandescent lamp and
halogen lamp load¹⁾ 230V 2000 W

Local control current at
230V control input 3.5 mA

Fluorescent lamp load 1000 VA
with KVG* in lead-lag circuit
or non compensated

Fluorescent lamp load with KVG* 500 VA
shunt-compensated or with EVG*

Compact fluorescent lamps 15x7 W
with EVG* and 10x20 W
energy saving lamps

Max. parallel capacitance 0.01 µF
(approx. length) of (30 m)

Standby loss (active power) 0.8 W

¹⁾ Applies to lamps of max. 150W.

Teaching-in wireless sensors in wire- less actuators

All sensors must be taught-in in the actuators so that they can detect and execute their commands.

Teaching-in actuator FMS61NP-230V

The teach-in memory is empty on
delivery from the factory. To ensure that
a device was not previously taught-in,
clear the memory completely:

Turn the upper rotary switch to CLR.
The LED flashes at a high rate. Within

10 seconds, turn the lower rotary switch
three times to right stop (turn clockwise)
and back again. The LED stops flashing
and goes out after 2 seconds.
All taught-in sensors are cleared; the
repeater and the confirmation telegrams
are switched off.

Clear individual taught-in sensors in the
same way as in the teach-in procedure,
except that you set the upper rotary switch
to CLR instead of LRN, and operate the
sensor. The LED previously flashing at a
high rate goes out.

If all the functions of an encrypted sensor
are cleared, teach-in must be repeated
as described under *Teach-in encrypted
sensors*.

Teaching-in sensors:

1. Setting of the lower rotary switch to
the desired teaching-in function:

The flashing of the LED as soon as a
new setting range has been reached
when turning the rotary switch helps
to find the desired position reliably.

RT1 = teach-in direction pushbutton
for contact 1 with the function 2xS;

UT1 = teach-in universal pushbutton
for contact 1 with the function 2xS;

UT2 = teach-in universal pushbutton
for contact 2 with the function 2xS;

E1 = teach-in universal pushbutton
for series pushbutton, 2S and WS;

RT2 = teach-in direction pushbutton
for contact 2 with the function 2xS;

Direction pushbuttons are completely
taught-in automatically when operating.

The side on which the pushbutton is
first operated is defined for switching
on, the other side for switching off. A
taught-in direction pushbutton RT1 or
RT2 acts as a **central pushbutton** in the
functions 2S, WS, SS1 and SS2. A
direction pushbutton has to be taught-in
into both channels RT1 and RT2 in the
function 2xS to act as a **central push-
button**.

2. Set the upper rotary switch to LRN.
The LED flashes at a low rate.

3. Operate the sensor which should be
taught-in. The LED goes out.

To teach-in further sensors, turn the
upper rotary switch briefly away from

position LRN. Continue the procedure from pos 1.

After teach-in, set the rotary switches of the actuators to the required function.

To prevent unintentional teach-in, teach in pushbuttons by 'double-clicking' (pressing rapidly twice in succession).

Within 2 seconds, turn the upper rotary switch three times to right stop LRN (turn clockwise). The LED flashes 'double'.

'Double-click' the pushbutton you want to teach in. The LED goes out.

To change back to teach-in with a 'single click', turn the upper rotary switch 3 times to right stop LRN (clockwise) within 2 seconds. The LED flashes at a low rate.

After a power supply failure, the device reverts automatically to teach-in with a 'single click'.

You can teach in unencrypted and encrypted sensors.

Teach in encrypted sensors:

1. Turn the upper rotary switch to LRN.

2. Turn the lower rotary switch three times to left stop (anticlockwise).
The LED flashes very rapidly.

3. Within 120 seconds, enable sensor encryption. The LED goes out.

Caution: Do not switch off the power supply.

4. Then teach in the encrypted sensor as described in *Teach in sensors*.

To teach in other encrypted sensors, turn the upper rotary switch briefly away from position LRN and then turn it to 1. With encrypted sensors, use the 'rolling code', i.e. the code changes in each telegram, both in the transmitter and in the receiver.

If a sensor sends more than 50 telegrams when the actuator is not enabled, the sensor is no longer recognised by the enabled actuator and you must repeat teach-in as 'encrypted sensor'. It is not necessary to repeat the function teach-in.

Switching on/off repeater:

If control voltage is applied to the local control input when the power supply is switched on, the repeater is switched on/off. When the power supply is

switched on, the LED lights up for 2 seconds = repeater off (as-delivered state) or 5 seconds = repeater on to indicate the state.

Switch-on confirmation telegrams:

For deliveries ex-works the confirmation telegrams are switched-off. Set the upper rotary switch to CLR. The LED flashes nervously. Now within 10 seconds turn the bottom rotary switch 3 times to the left (anticlockwise) and then back away. The LED stops flashing and goes out after 2 seconds. The confirmation telegrams are switched-on.

Switch-off confirmation telegrams:

Set the upper rotary switch to CLR. The LED flashes nervously. Now within 10 seconds turn the bottom rotary switch 3 times to the left (anticlockwise) and then back away. The LED goes out immediately. The confirmation telegrams are switched-off.

Teaching-in feedback of this actuator

in other actuators: Contact 1: Set the upper rotary switch to 2xS. For changing of switching state and simultaneously transmitting of feedback the local control input has to be applied.

Contact 2: Turn the upper rotary switch from 2S to WS, contact 2 switches on and the corresponding feedback will be sent. Turn the upper rotary switch from WS to 2S, contact 2 switches off and the corresponding feedback will be sent.

Teaching- in feedback of other actuators

in this actuator: Teaching-in feedback other actuators is only reasonable if this actuator is run in function setting 2S or 2xS. The confirmation telegrams will be taught-in as a central pushbutton. After teaching-in set the rotary switch to the desired function.

When an actuator is ready for teach-in (the LED flashes at a low rate), the very next incoming signal is taught-in. Therefore, make absolutely sure that you do not activate any other sensors during the teach-in phase.

EnOcean wireless

Frequency	868.3 MHz
Transmit power	max. 10 mW

Hereby, Eltako GmbH declares that the radio equipment type FMS61NP-230V is in compliance with Directive 2014/53/EU.

The full text of the EU declaration of conformity is available at the following internet address: eltako.com
