LOCKOUT PROTECTION ON THE PATIO DOOR

The timed lowering of roller shutters and blinds is simple and convenient. However, if a balmy summer evening on the patio lingers a little longer, the automated function also carries the risk of not being able to get inside in time to stop the shutter.

A window handle sensor, which is simply placed under the existing window handle, or a window/door contact, detects the still-open patio door and thus prevents the roller shutter from lowering at that point.

Once the door is closed, it is again assigned to the timed function for the next raising or lowering.
